Health eating in pregnancy

Healthy eating is part of a balanced, healthy lifestyle, and pregnancy is one time in a woman's life when attention to a healthy diet is most important. In addition to gaining adequate nutrients for yourself and your baby, there are a few recommendations that apply to pregnant women to minimise risks in their pregnancy:

- Aim for a balanced diet, supplemented with folate (400mcg/day) and iodine (150mcg/day). Many pregnancy multivitamins contain these in different amounts, so always check the label. Be sure to only take multivitamins that are *specific for pregnancy*, as others may contain levels of some nutrients that are harmful in excess in pregnancy (such as vitamin A).
- Your iron needs are increased. Good dietary sources include red meats, fortified breads and cereals, green leafy vegetables and some nuts.
- Fish intake needs to be limited. Generally, the larger the fish, the less frequent you should eat it. This is because fish contain mercury, which can be harmful in excess. As bigger fish eat smaller fish, the bigger fish accumulate the smaller fish's mercury; hence very large fish often contain high levels of mercury. In general, fish should be limited to 2-3 serves per week of fish with low mercury levels (such as mackerel, snapper, atlantic salmon); once per week if large fish (for example, tur marlin or swordfish... Fish lovers can find a handy guide [here](#)).
- Avoiding listeriosis and toxoplasmosis: wash fruit and vegetables thoroughly, and avoid eating the following: raw meats, raw, uncooked, or smoked meats/seafood, unpasteurised milk, soft serve ice creams, and soft cheeses. Cook
- Caffeine. Some studies suggest a link between high caffeine intake and miscarriage. Although no robust evidence in slowly metabolised in pregnancy and should best be limited to one coffee (or two cups of tea) per day.

For more detailed information, see the Australian [Healthy Eating Guidelines for Pregnant Women](#).

Exercise advice

- Safe levels include exercising up to 3 times per week, for a maximum of about 30-45 minutes.
- You should limit exercise to that of a mild or moderate level. This means you should still be able to talk in sentences whilst exercising.
- Avoid overheating (such as exercising in middle of day or outside on hot days) and drink plenty of water, during and after.
- Contact sports should be avoided after 12 weeks (non-contact sports may continue as long as you are comfortable).
- Sports or exercises associated with vigorous or sudden movements may cause or exacerbate back pain.
- Walking and aqua-aerobics are ideal forms of exercise in pregnancy.
